Testoviron 250 by Schering

Testoviron is an injectable steroid made by **Schering**, its active substance is Testosterone Enanthate.

Testosterone Enanthate is probably the most commonly used form of testosterone by both athletes and bodybuilders alike.

Testoviron 250 is an oil based injectable **steroid**, which is designed to slowly release testosterone from the injection site. This slow release delivery leads to an elevation in testosterone levels lasting for approximately two weeks (it may even take as long as three weeks for the drug levels to fully diminish). Due to its relatively long activity level,

Testosterone Enanthate is favored by the medical profession and is primarily used to treat cases of hypogonadism and similar disorders where low androgen levels are at fault. As with all testosterone products it has strong **anabolic** and androgenic activity. Gains in strength and muscle mass are notable, along with an increase in libido. It has also been noted that a relief in tendon pain and an increase in stamina are direct effects of

Testoviron administration. This is probably due to increased water retention coupled with an increase in red blood cells – leading to a greater oxygen uptake in the blood.

Testosterone is a highly **anabolic** and androgenic hormone, it has an anabolic (muscle building) as well as anabolic rating of 100 each, respectively. **Testoviron 250** exerts the majority of its effects by promoting increased nitrogen retention in the muscle. Testoviron 250 is also known to increase levels of the growth factor IGF-1 in both the muscle tissue as well as the liver. This steroid also increases the activity of satellite cells, which are cells that play an active role in repairing exercise-damaged muscle. **Testoviron 250** exerts these effects primarily by genomic mechanisms, meaning that it binds to the androgen receptor (AR) thus initiating gene transcription. This stimulation of the AR promotes various of the AR dependant mechanisms for both muscle gain and fat loss, as well as reducing catabolic glucocorticoid hormones, and increasing red blood cell production.

HOW CAN YOU EARN MANY

Weekly totals of 250-1000mg weekly are frequently used, and sometimes more for the highly advanced athlete. Due to the relatively long half life of Testoviron 250 (4-5 days), injections are usually administered twice per week. This will allow stable blood levels to be maintained. When the level of steroid tapers down, a new injection is made, keeping everything fairly level. This is unlike Sustanon, which requires more frequent injections for the same effect. For a first cycle, 500 mg alone of Testoviron 250, shot two times weekly (Monday and Thursday for example), for 10 weeks along with standard post cycle therapy would be very sufficient for good gains.

As the best mass builder available, Testoviron 250 stacks well virtually everything and can also be used alone with high levels of success. Due to the longer half life of Testoviron 250, a dose of 500 mg per week can be used for the first time user for a period of 10 weeks with very good results. Stacking oral steroid on a first cycle is generally considered unnecessary, because it is impossible to gauge your body's responsiveness to the individual steroids being used and determine which ones cause which side effects. For the more advanced athlete, doses of 500 - 1000 mg of Testoviron 250 are also excellent for creating clear results within a 10 week period. More advanced athletes will often stack Testosterone Enanthate with Dianabol, Deca Durabolin, Primobolan or Equipose to create a powerful mass building stack.

All testosterone aromatize, and enanthate is no exception. The steroid user should be familiar with anti-estrogen compounds such as Nolvadex and Clomid and keep them on hand during cycle in case symptoms of gyno arise. Increases in water weight and fat weight should be expected, and the possibilities of gyno are always out there when using Testoviron 250.

Standard post cycle therapy consisting of either Nolvadex or Clomid should take place after the cycle is over.

SIDE EFFECTS:

Side effects such as water retention usually occur when using Testosterone Enanthate. Gyno, increased rate of hair growth, back acne, increased blood pressure, and aggressiveness, both in the gym and out, are possible when using this steroid. The liver is accustomed to processing testosterone, so liver toxicity is normally not a concern except at extremely high doses.

Testoviron is a line of anabolic steroids made by Schering Pharmaceuticals comprised of Testoviron, a mixture of Testosterone-Enanthate and Testosterone-Propionate and Testoviron Depot a single ester Testosterone-Enanthate compound. Both forms of Testoviron are highly popular with the Depot version being much more highly available. With either form you are receiving some of the absolute best testosterone hormones money can buy as Schering is considered top of the line; in many circles Testoviron Depot is considered the crème de la crème in Testosterone-Enanthate, so much so it is the only one many athletes will use.

As there are two forms and as both are highly popular due to the extreme level of quality, as is common in the anabolic steroid world both Testoviron and Testoviron Depot are regularly counterfeited by unscrupulous underground labs. Nevertheless, true Testoviron Depot will come in a 1ml ampule dosed at 250mg/ml, however, Testoviron, the Propionate/Enanthate mixture can be found in 4 distinct doses, 50mg/ml, 100mg/ml, 135mg/ml and 250mg/ml. While there are 4 distinct forms 100mg/ml and 135mg/ml are often more commonly found, the total dosing of each is as follows:

- 50mg/ml: Testosterone-Propionate 20mg, Testosterone-Enanthate 30mg
- 100mg/ml: Testosterone-Propionate 25mg, Testosterone-Enanthate 75mg
- 135mg/ml: Testosterone-Propionate 25mg, Testosterone-Enanthate 110mg
- 250mg/ml: Testosterone-Propionate 50mg, Testosterone-Enanthate 200mg

Regardless of the form you have, to understand Testoviron you only need understand the hormone testosterone and then how the ester or various esters affect it. Testosterone is a hormone essential to both men and women although to a far greater degree in men. Highly and equally anabolic as it is androgenic, as is such by its nature testosterone is responsible for a host of functions in the body revolving around muscular structure, growth, metabolism and sexual characteristics. Those who suffer from low levels of the hormone will see each aspect diminished greatly, while those who increase their levels of testosterone will enhance everyone to a great degree. When looking at a particular synthetic testosterone, which is exactly what Testoviron is, to fully understand its function in-terms of mode of action you must understand the ester(s) attached. The ester attached to the testosterone or any hormone for that matter is not a hormone, it is not what brings about the desired action; in the case of Testoviron, regardless of the form it is the testosterone itself that does the work, not the Enanthate or Propionate. Esters are defined by their size; the larger the ester the more mass it takes up in the compound; the shorter the ester the faster the hormone becomes active but the larger the ester the longer its effects will last post

administration. As Testoviron Depot is comprised of Testosterone-Enanthate it is a long ester based testosterone with a half-life of approximately 10.5 days, however, Testoviron, which is comprised of both Testosterone-Enanthate and Propionate forms, due to the Propionate being a short ester it will carry a much shorter overall half-life in total form but the same half-life as Testoviron Depot in terms of active testosterone.

The Benefits of Testoviron:

The benefits of Testoviron are the same as any other testosterone and the benefits are tremendous; however, because Testoviron is such a quality form you can rest assured each and every benefit will be to the greatest extent possible. Perfect for bulking and cutting Testoviron and Testoviron Depot both have the ability to provide every benefit an athlete would be after, as testosterone itself is the ultimate hormone. Generally well-tolerated by healthy adult men, even in large doses, those who supplement with Testoviron can expect to create an internal environment apt towards growth, a lean physique and greater physical strength.

While the traits it can enhance are truly great it gets even better. Testoviron, as it is testosterone, when testosterone levels are increased so are our IGF 1 levels. IGF 1 is a very powerful anabolic hormone in its own right and correlates with human growth hormone to a great degree, another essential hormone with phenomenal qualities. As is such, by increasing testosterone levels, in-turn increasing the efficiency of other naturally occurring hormones we thereby increase our level of positive productivity in the body; increasing metabolic efficiency, muscle tissue stimulation and regeneration and in short bringing forth a physique far greater than could otherwise be obtained.

The Side-Effects of Testoviron:

Regardless of the form you use, Testoviron or Testoviron Depot there are possible negative side-effects to use and they are identical with each form and identical to every form or brand of testosterone. As Testoviron is a medication, like all medications it carries with it possible side-effects; this is the case with all steroidal and non-steroidal medications, even those sold over the counter, such as common cough syrup and headache medication; many of which carry far worse possible side-effects than testosterone or any anabolic steroid. However, as it pertains to testosterone, when we use Testoviron or any other form, when we use responsibly and take necessary precautions in most cases the side-effects can be controlled and often non-existent.

The most common side-effects brought on by Testoviron are of an aromatase effect. Testosterone will convert to estrogen through the aromatase process and can bring about such negative effects such as Gynecomastia, water retention, blood pressure and cholesterol issues to name a few. While these side-effects can be problematic they are not without solution; however, the side-effect of testicular atrophy is assured in all but in most cases inconsequential. Through the use of Testoviron or any testosterone form, when exogenous testosterone is present natural production is no longer necessary and it will come to a halt. As testosterone is produced in the testicles in men, once production ceases to exist the testicles shrink; however, once exogenous use is discontinued and natural production begins again the testicles return to their normal size.

As estrogenic side-effects such as the ones mentioned above can be very problematic all hope is not lost; far from it. As these effects are caused by the advent of estrogen, by supplementing with an aromatase inhibitor such as Arimidex or Letrozole we can greatly reduce such affects and many times completely eliminate them. Just as important, as it pertains to blood pressure, cholesterol and other similar actions, a healthy diet is imperative; diets that are sufficient in healthy Omega Fats as well as those who condition with regular cardiovascular training greatly reduce the chances of many negative effects commonly associated with many anabolic steroids.

Testoviron or Testoviron Depot?

With either form you're receiving the same active testosterone hormone and you can receive the same exact dose with either form depending on how you administer it. In terms of benefits and risk they are the same regardless of the form you use, assuming doses, training and nutrition remain constant with either form. For example, if you supplement with Testoviron, train hard and eat well you will benefit greatly. Conversely, your next go around if you choose Testoviron Depot and supplement with the same dose as before but slack in your training and eat poorly your results will not be as good; it's not rocket science but it must be mentioned as many fail to recognize this truth. In the end, those that choose Testoviron will experience a more rapid buildup of testosterone in the body due to the Propionate form being attached; however, through long-term use that stretches over an extended period of time dosed in regular intervals there is truly no advantage to one over the other in this regard.

Testoviron Cycles & Doses:

As Testoviron is a fantastic choice regardless of the goal it is the perfect choice for any cycle or stack. Testosterone is often the foundation of an anabolic steroid cycle, as it should be and many times if only one steroid is going to be used the only one really needed in this instance. Regardless if you're using one steroid or stacking Testoviron with others long term use is needed if results are going to be not only obtained but held onto in a more permanent nature once use is discontinued. In most cases 8 weeks will prove to be the minimal time frame for quality use with 12-16 weeks being far more optimal.

Most beginners will find 500mg per week to be the perfect starting point and generally very well-tolerated in terms of side-effects. As 500mg per week is a good beginners dose it is also a fine dose for many experienced steroid users and often all the testosterone many individuals will ever need. However, greater doses can be used and done so safely; 1,000mg per week is very common place among veteran performance enhancing athletes and even beyond in many bodybuilding and power lifting circles.

Always understand the truth, testosterone carries with it a risk to reward ratio that is very real. The more Testoviron you use the greater your reward will be. However, the more Testoviron you use the greater your risk will be as well; in the end the risk you decide to take is on you and you alone.

As for your Testoviron cycle, most will find 8 weeks of use to be the bare minimum with 16 weeks being far more efficient. Regardless of your duration of use a solid post cycle therapy (PCT) plan must be in place. Because Testoviron is a blend of two different products, namely testosterone with the propionate (short) ester attached, and testosterone with the Enanthate (long) ester attached. Confusingly, Schering, who produces this product, also has a pure testosterone Enanthate product of the same name. Testosterone is usually attached to an ester (i.e. when you buy testosterone propionate, or Enanthate the components of this particular drug, you are buying testosterone with a propionate ester attached and testosterone with an Enanthate ester attached, both in the same milliliter of drug). These esters determines how long it takes your body to dispose of the testosterone, and propionate is the shortest ester commonly available with a testosterone base (of course, testosterone suspension

has no ester), whereas Enanthate is the longest generally available with a testosterone base. Within your body, there are enzymes, called esterases, which have the function of removing the ester from steroids, and leaving you with just the steroid molecule with the ester cleaved off. Depending on how heavy the ester chain is, that determines how long it takes the esterase to remove it. With this product, you have testosterone with a heavy chain (which will take your esterases awhile to remove) as well as with a short chain (which your esterases will quickly remove).

What happens when those esters are removed?

Well, then the Testosterone you have injected induces changes in the shape as well as the size of your muscle fibers and also can change the appearance and the number of those(7). Testosterone is also noted for its ability to protect your hard earned muscle from catabolic (muscle wasting) glucocorticoid hormones (8), thus inhibiting their ability to send a message to muscle cells to release their stored protein. Concomitantly, Testosterone sends a message to muscle cells to actually store more contractile protein (called actin and myosin); glucocorticoid hormones send the opposite message. In addition, Testosterone has the ability to increase erythropoiesis (red blood cell production) in your kidneys(9), and as we all know, a higher Red Blood Cell (RBC) count would most likely improve endurance via bringing more highly oxygenated blood to your muscles. Having more RBCs can also improve recovery from strenuous physical activity. It needs to also be noted that aggression levels often rise dramatically with the use of exogenous testosterone (15).

All of these great benefits are to be had with the use of either testosterone Enanthate or propionate alone, but realistically, Testoviron will be part of a cycle containing one or more other drugs. People who are bulking will probably choose to use another drug like Deca or Eq (possibly with Dbol as well) and those who are cutting will probably steer towards Eq and perhaps Trenbolone. Very often users will shoot this drug three or four times a week, but blood levels of testosterone from the testosterone Enanthate component would still be above baseline with this drug at around day eight (16), even though we know the other component would peak and fall much more rapidly.

The advantage to longer esters is that they need to be injected less frequently (test prop needs to be injected every other day while you can shoot test cyp once a week). The disadvantage to long ester steroids is that they contain less actual steroid. Anecdotally, however, most people from Steroid.com and other discussion boards who have tried differing esters on their various cycles agree: Testosterone Propionate causes the least side effects and the least bloating, while Enanthate causes the most. Also, any injected testosterone will inhibit your natural test levels and HPTA (Hypothalamic Pituitary Testicular Axis). A Hundred mgs of test/week takes about 5-6 weeks to shut the HPTA, and 250-500mgs shuts you down by week 2 (4).

Testoviron Stack

What stacks well with Testoviron? Well, since it's a testosterone with both a short and long acting component, I suppose the answer is everything and nothing. Since it's got a short ester in it, you would have to inject it every other day, so you may as well run another short acting drug with it (Trenbolone Acetate, or whatever). However, since it's got a long acting component to it, you may consider using a longer acting drug with it (Deca or Eq, perhaps); the downfall here is that you don't get the full benefit of shooting test prop alone (less water retention, etc...) but you still have to shoot as frequently as if you were only using prop. The testosterone Enanthate is long acting, but you're still going to be shooting this compound every other day to make use of the propionate component. Thus, the advantage of testosterone Enanthate (reduced shooting frequency) is negated. Many people's favorites are Eq (boldenone undecylenate) or Deca (nandrolone decanoate), but really, anything will stack well with testoviron. Tren (Trenbolone Acetate), Masteron, and/or Winstrol are also favorites for many on a cutting cycle, and it's important to note that a product to fight water-retention and other estrogenic sides would be warranted if Testoviron were used for a cutting cycle.

Finally, it's worth noting that sometimes a strategy known as "frontloading" is employed with products like this one, since it contains both testosterone propionate, and Enanthate. This is where double or triple the intended dose for the cycle is injected for the first two weeks, and the propionate ester gives a very quick rise in blood plasma levels of testosterone, and then the Enanthate ester is relied on for a more even blood level in the ensuing weeks. The reasoning behind this is presumably to get the blood levels of the drug up quickly in the hopes of seeing results more quickly, and then have the blood levels even out and stay constant.

Of all testosterones available on the market today, blended ester products like this one are the most unjustifiably expensive. This is both because they are in high demand, as well as more rare than single ester products. You

can only find Testoviron in the Dominican Republic and Italy (135mg versions available in both countries). Expect to pay up to \$5-7 for an amp of this stuff, and if your source is asking for more, expect to walk away. When the price of testosterone is so low, I can't justify purchasing a blended product for any more than you would purchase a single esterated test.

Testoviron Profile

- (Testosterone Propionate + Testosterone Enanthate)
- 17b-hydroxy-4-androsten-3-one
- Testosterone base + Enanthate ester+ Propionate Ester
- Molecular Weight: 412.6112
- Molecular Weight (base): 288.429
- Molecular Weight (Enanthate ester): 130.1864
- Molecular Weight (Propionate ester): 74.0792
- Formula (base): C19 H28 O2
- Formula(Enanthate ester):C7 H12 O
- Formula (Propionate Ester): C3H6O2
- Melting Point (base): 155
- Effective Dose (Men): 300-2000mg+ week
- Effective Dose (Women): Not recommended
- Active life: 8 days
- Detection Time: 3 months
- Anabolic/Androgenic ratio:100/100
